

Most current heart failure (HF) treatments follow a ‘one-size-fits-all’ approach.

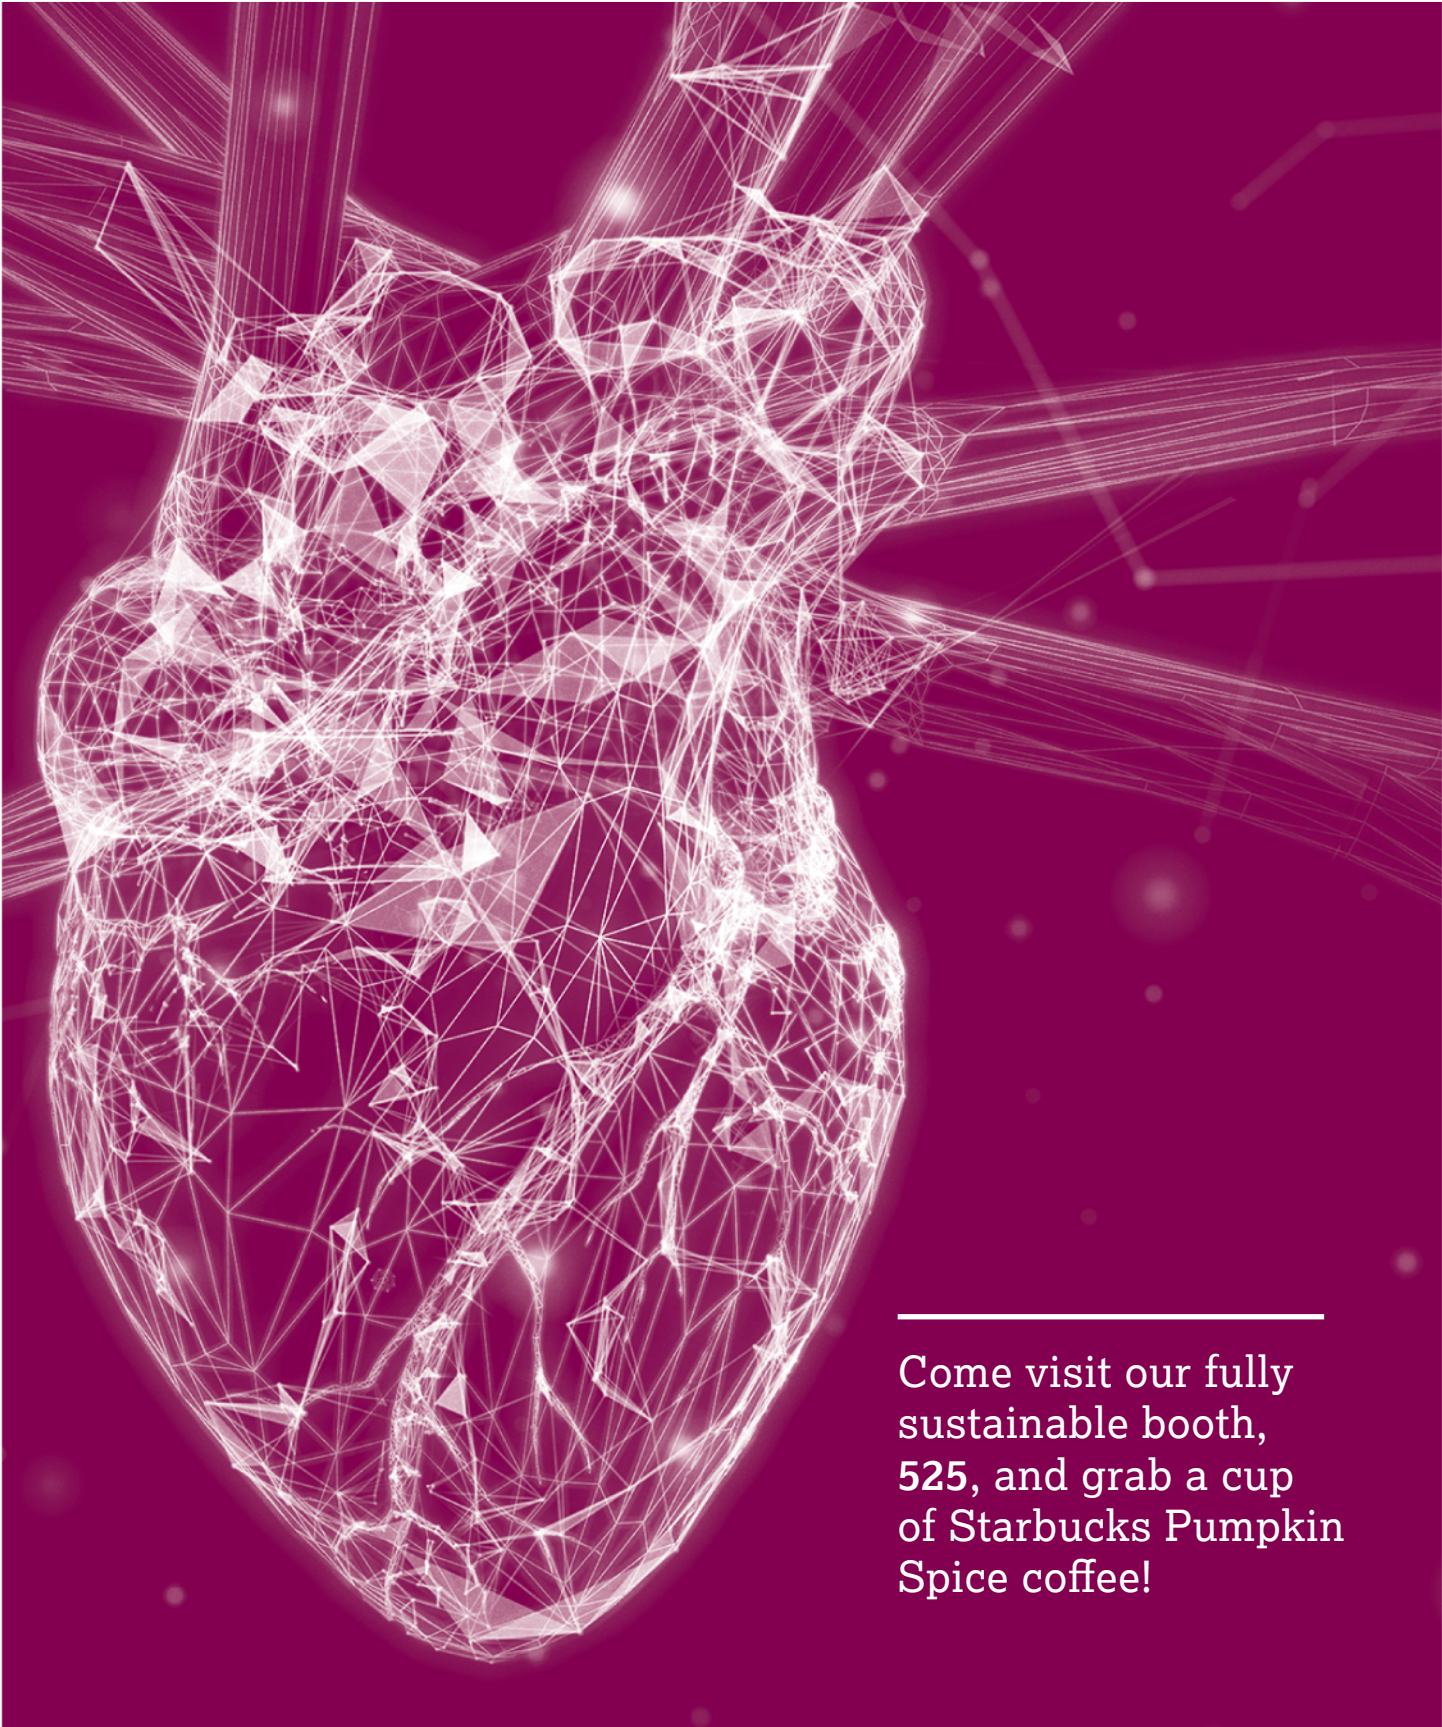

However, due to the wide range of mechanisms by which HF can occur, this one-size approach may not fit each of the **~64 million people** affected by the condition.

This is why AstraZeneca scientists are dedicated to uncovering the underlying etiology of HF to identify novel disease drivers. By harnessing the power of next-generation therapeutics, **we aim to pave the way to a cure.**

---

Visit booth 525 to learn more about how AstraZeneca is advancing the science in HF and amyloidosis.
